June 1, 2011

Dear Cosmetologist and Barbers:

The U.S. Department of Labor’s Occupational Safety and Health Administration have issued a hazard alert to hair salon owners and workers about the potential formaldehyde exposure from working with some hair smoothing and straightening products. The Arizona Division of Occupational Safety and Health (ADOSH) is also issuing the same hazard alert and in doing so desires that this hazard alert be distributed to cosmetology and barber schools, and licensing entities that may have direct use of products that contain formaldehyde and/or other chemicals such as methylene glycol, formalin, methylene oxide, paraform, formic aldehyde, methanal, ox methane or oxymethylene.

ADOSH has found formaldehyde in the air when stylists used hair smoothing products, some of which do not have formaldehyde listed on their labels or in material safety data sheets as required by law. During one investigation, the agency's air tests showed formaldehyde, even though the product tested was labeled as formaldehyde-free.

Formaldehyde presents a health hazard if worker are exposed. It can irritate the eyes and nose; cause allergic reactions of the skin, eyes and lungs; and is linked to nose and lung cancer.

ADOSH requires manufacturers, importers and distributors of products that contain formaldehyde as a gas or in solution, or that can release formaldehyde during use, to include information about formaldehyde and its hazards on product labels and in the material safety data sheets that are sent to employers.

Workers have the right to know the risks associated with the chemicals with which they work, and how to protect themselves, and employers need to know these risks in order to ensure the safety and health of their employees.

To eliminate potential worker exposure, ADOSH recommends that salon owners use products that do not contain formaldehyde, methylene glycol, formalin, methylene oxide, paraform, formic aldehyde, methanal, oxomethane, oxymethylene. All of these chemicals are names for or treated as formaldehyde under OSHA’s Formaldehyde standard.
If a salon owner decides to continue using a formaldehyde-containing hair smoothing product, then he or she must follow ADOSH’s formaldehyde standard. Important requirements of this standard, some of which are dependent upon actual formaldehyde exposure levels, include conducting air monitoring, installing ventilation where needed and training workers about formaldehyde, as well as providing protective equipment such as gloves, chemical splash goggles, face shields and chemical resistant aprons.

The material safety data sheet includes important information about what a product contains and how the ingredients can affect a worker’s health. Salon owners and other employers must have a material safety data sheet for any of the products they use that contain hazardous chemicals. They must also make the sheet available to stylists, barbers and other workers.

ADOSH has attached a copy of the Hazard Alert issued by the federal Department of Labor as it contains specific information that needs to be communicated to your employees and measures that need to be taken to prevent employee injury or illness.

If you have specific questions or concerns with potential exposure to these chemicals, ADOSH has a Consultation Section which will assist employers with all safety/health concerns while ensuring the employer’s anonymity. To contact the Consultation Section of ADOSH: Phoenix 602-542-1634 or Tucson 520-320-4222

Let’s work together to provide the safest working environment possible for Arizona employees.

Sincerely

Darin Perkins
Director
HAZARD ALERT

Hair Smoothing Products That Could Release Formaldehyde

The Occupational Safety and Health Administration (OSHA) and several State OSHA programs are investigating questions and complaints from hair salon owners and workers about possible formaldehyde exposure from using Brazilian Blowout and other hair smoothing products. Some of these products have been labeled as "formaldehyde-free." Oregon’s Occupational Safety and Health Administration California’s Occupational Safety and Health Administration the Connecticut Department of Public Health, and several other state agencies have already issued warnings about these products to salon owners, stylists, other salon workers, and clients. This Hazard Alert provides information about OSHA’s investigations, the health hazards of formaldehyde, and how to protect workers using hair smoothing products that contain or release formaldehyde.

What have OSHA’s investigations found?

Federal OSHA and State OSHA programs are investigating complaints from stylists and hair salon owners about exposure to formaldehyde while using GIB LLC dba (doing business as) Brazilian Blowout products and other hair smoothing products. OSHA has found formaldehyde in the air when stylists use hair smoothing products. Some had "formaldehyde-free" on the label or did not list formaldehyde on the product label or in the Material Safety Data Sheet (MSDS).

During one investigation, Federal OSHA’s air tests showed formaldehyde at levels greater than OSHA’s limits in a salon using Brazilian Blowout Acai Professional Smoothing Solution, even though the product was labeled "formaldehyde-free." In most cases, OSHA found that hair salon owners did not know that a hair smoothing product contained or could expose workers to formaldehyde because manufacturers, importers, and distributors did not include the correct warnings on product information. California OSHA recently found violations at one importer and distributor, GIB LLC dba Brazilian Blowout, that failed to list formaldehyde as a hazardous ingredient on the MSDS provided to downstream users (e.g., salon owners, stylists) for two products: Brazilian Blowout Acai Professional Smoothing Solution and Brazilian Blowout Professional Brazilian Blowout Solution. The MSDS also did not list the health effects from formaldehyde
exposure. The MSDS is required to provide users information about the chemicals in a product, the hazards to workers, and how to use a product safely.

Recent reports from Oregon OSHA, California OSHA, and now Federal OSHA should alert salon owners and stylists to look closely at the hair smoothing products they are using to see if they contain methylene glycol, formalin, methylene oxide, paraform, formic aldehyde, methanal, oxomethane, oxymethylene, or CAS Number 50-00-0. All of these are names for or treated as formaldehyde under OSHA’s Formaldehyde standard. Products containing them can expose workers to formaldehyde; employers who manufacture, import, distribute, or use the products must follow OSHA’s formaldehyde standard.

The first report about formaldehyde in hair smoothing products surfaced when Oregon OSHA investigated a complaint from a hair stylist who had nosebleeds, eye irritation, and trouble breathing while using a Brazilian Blowout product labeled “formaldehyde-free.” After testing the product, Oregon OSHA found that the product contained formaldehyde, a chemical that can cause the health problems reported by the stylist. Oregon OSHA tested more than 100 samples of keratin-based hair smoothing products and found formaldehyde levels in some products well above what could legally be labeled as "formaldehyde-free.” In addition to the Brazilian Blowout products, Oregon OSHA found that other manufacturers, importers, and distributors of hair smoothing products also had not listed formaldehyde or included hazard information on the label or in the MSDS. Based on these findings, Oregon OSHA published a Hazard Alert in October 2010. Oregon OSHA also alerted Federal OSHA and State OSHA programs where the products were manufactured, imported, or distributed because the hazard information for the product was not correct and did not meet the requirements of OSHA’s Hazard Communication standard 29 CFR 1910.1200.

OSHA continues to work with other agencies (e.g., Food and Drug Administration, National Institute for Occupational Safety and Health) to look at formaldehyde exposures in other salons and to make sure that workers and the public have correct information about these products. More information on the background and reports from OSHA can be found on osha.gov website.

What is formaldehyde and how can it affect my health?

Formaldehyde is a colorless, strong-smelling gas that presents a health hazard if workers are exposed. You can be exposed to formaldehyde if you breathe it into your lungs, if it gets into your eyes, or if it is contained in a product that gets onto your skin. You can also be exposed accidentally if you touch your face, eat food, or drink after using a product containing formaldehyde without first washing your hands. It can irritate the eyes and nose, and cause coughing and wheezing. Formaldehyde is a "sensitizer," which means that it can cause allergic reactions of the skin, eyes, and lungs such as asthma-like breathing problems and skin rashes and itching. When formaldehyde is in a product that gets sprayed into the eyes, it
can damage the eyes and cause blindness. It is also a cancer hazard. Formaldehyde is a health hazard, whether in a product or in the air. OSHA's Formaldehyde standard 29 CFR 1910.1048 covers employers who use formaldehyde, and products that contain or release formaldehyde. (OSHA has also published a formaldehyde fact sheet see osha.gov website)

Why do some hair smoothing products expose me to formaldehyde?

Many keratin-based hair smoothing products contain formaldehyde dissolved (and chemically reacted) in water and other ingredients in the product. Because of the way the formaldehyde reacts in these products, some manufacturers, importers, or distributors might list other names for formaldehyde on product information or might claim that the product is "formaldehyde free." Formaldehyde might be listed as methylene glycol, formalin, methylene oxide, paraform, formic aldehyde, methanal, oxomethane, oxymethylene. All of these are names for formaldehyde under OSHA's Formaldehyde standard. The bottom line is that formaldehyde can be released from hair smoothing products that list any of these names on the label and workers can breathe it in or absorb it through their skin. Workers can be exposed to formaldehyde during the entire hair straightening process, especially when heat is applied (e.g. blow-drying, flat ironing).

How would I know if the product I'm using could expose me to formaldehyde?

Read the product label and MSDS to determine if they list methylene glycol or any of the other names for formaldehyde listed above. If they do, the product can expose you to formaldehyde. Under OSHA's Hazard Communication standard, salon owners and other employers must have an MSDS for each product used in the salon that contains a hazardous chemical. Employers need to review the MSDSs they receive and make sure they understand the hazards of the products they use in their salon(s). They must also make the MSDSs available to their workers (e.g., stylists) and train all workers using the product about the hazards and how to use it safely. If employers do not receive an MSDS automatically, they should request one. If the MSDS does not look complete (e.g., blank spaces that are not completed) then the employer should request a new one from the manufacturer. If the request does not produce the information needed, then the employer should contact the local OSHA Area Office for assistance in obtaining the MSDS.

Be aware that an MSDS may not contain all of the hazard information required, as initially found in the case of Brazilian Blowout products. In the Oregon case, it was only after a stylist reported health problems while using the products that the investigation began. Workers need to report any health problems they think are from the products they use in the workplace to their employer and employers need to follow up on reports of health problems from workers.
When are manufacturers, importers, and distributors of hair smoothing products required to list formaldehyde as an ingredient in their products?

OSHA requires manufactures of products that contain or release formaldehyde to include information about formaldehyde and its hazards on the label and in the MSDS. Formaldehyde must be listed if it is in the product at 0.1% or more (as a gas or in solution) or if the product releases formaldehyde above 0.1 parts of formaldehyde per million parts of air. Salons and other employers that directly import hair smoothing products from other countries have the same responsibilities as a manufacturer under the Hazard Communication standard - they must determine the hazards of the product and develop labels and MSDSs that communicate the hazards to users. These requirements are explained in OSHA’s Hazard Communication standard (commonly referred to as the "Worker’s Right-to-Know Rule") and OSHA’s Formaldehyde standard.

What can I do to reduce exposure to formaldehyde when using formaldehyde releasing hair smoothing/straightening products?

Employers, stylists, and other salon workers should read the product information and MSDSs for the products they buy and use so that they know what chemicals are in them and how to use them safely in the workplace. The best way to control exposure to formaldehyde is to use products that do not list formaldehyde, formalin, methylene glycol, or any of the other names for formaldehyde listed above on the label or in the MSDS. Beauty care companies are now making and selling products that they claim do not contain formaldehyde in the solution. Choosing one of these products might eliminate the risk of formaldehyde exposure. Note that just because a product doesn’t list formaldehyde, formalin, or methylene glycol does not mean that it does not contain any other hazardous ingredients.

If salon owners decide to use products that contain or release formaldehyde, then they must follow the requirements in OSHA’s Formaldehyde standard (29 CFR 1910.1048). The standard requires that employers test the air to find out the level of formaldehyde present in the air when the product is being used. If the test shows that formaldehyde is present at levels above OSHA’s limits (0.75 parts of formaldehyde per million parts (or ppm) of air during an 8-hour work shift or 2 ppm during any 15-minute period), then the employer must:

Install air ventilation systems in the areas where these products are mixed and used to help keep formaldehyde levels below OSHA’s limit and perform regular maintenance to make sure the systems work correctly;
When possible, require workers to use lower heat settings on blow-dryers and flat irons used during the process;
Give workers respirators, if needed; train them to use the respirator properly; and meet the other requirements in OSHA’s Respiratory protection standard;
Ensure workers understand the information on a product’s label and MSDS;
Post signs at entryways to any area where formaldehyde is above OSHA’s limit to tell workers of the danger and stating that only authorized personnel may enter; Tell workers about the health effects of formaldehyde, how to use the product safely, and what personal protective equipment to wear while using the product; and train workers how to safely clean up spills and properly throw products out. In addition, where the tests show that formaldehyde is present in the air at a level of 0.5 ppm during an 8-hour work shift or 2 ppm during any 15-minute period, then the employer must:

Get workers the right medical attention (e.g., doctor exams), and Test the air periodically to make sure that formaldehyde levels are below OSHA’s limits.

Whether or not air tests show formaldehyde levels above OSHA’s limits, employers must follow certain parts of the standard if a product contains formaldehyde:

Give employees appropriate gloves and other personal protective equipment (e.g., face shield, chemical splash goggles, chemical-resistant aprons) and train them on how to use this equipment while mixing and applying the products;
Explain to workers how to read and understand the information on a product’s label and MSDS;
Make sure the workplace has eye and skin washing equipment if products that contain formaldehyde could be splashed onto the workers’ skin or into their eyes;
Train workers how to safely clean up spills and properly throw products out, and;
Get workers the right medical attention (e.g., doctor exams) if they develop signs and symptoms of an exposure to formaldehyde or are exposed to large amounts of formaldehyde during an emergency (e.g., a large spill).

Employers must also keep records of the air tests they perform, any medical attention needed by their employees, and respirator fit-testing.

For more information about how to control formaldehyde exposures in hair salons, read Oregon OSHA’s hazard alert and Cal/OSHA’s Advisory.

How can OSHA help you?

OSHA continues to monitor ongoing inspections that may have nationwide impact to ensure that health hazards and appropriate protections for products containing hazardous chemicals are communicated properly on the labels and MSDS. OSHA developed this webpage to give workers and employers useful, up-to-date information on formaldehyde hazards that might be present when using hair smoothing products that contain or release formaldehyde. Employers and workers should read OSHA’s Formaldehyde Fact Sheet for more information about formaldehyde hazards and how to work with it safely. Contact your local ADOSH office if you have any questions about a product that you are using or its
MSDS. Hair salon owners can also contact ADOSH’s free and confidential consultation service to help determine if there are hazards at their workplace. On-site consultations do not result in penalties or citations. To contact ADOSH’s consultation service, call 1-602-542-1634 or 1-520-628-5478

**What rights do workers have?**

Workers have a right to a safe workplace. The *Occupational Safety and Health Act of 1970* (OSH Act) was passed to prevent workers from being killed or seriously harmed at work. The law requires employers to provide their workers with a workplace that is free of potential hazards. The OSH Act created the Occupational Safety and Health Administration (OSHA), which sets and enforces protective workplace safety and health standards. OSHA also provides information, training and assistance to workers and employers. Workers may file a complaint to have ADOSH inspect their workplace if they believe that their employer is not following OSHA standards or that there are serious hazards.
